Introduction

Limecraft's seventh release of 2026 (2026.7) is scheduled for roll out on October 27th, and introduces the following set of new and extended functions and improvements.

New and Extended Features

Workflow Library and Purge Workflows

In this release, a new **Workflow Engine foundation** ('Workflow Library') is introduced to make available consistent and reliable workflow customisation for a variety of applications. This foundation will support the roll out of more standardised functionalities in material lifecycle management, AI-based enrichments, and media content processing tasks with a consistent feature set and look and feel for various types of workflows.

Configuration - Purge material 

With this workflow, you can delete material versions that are no longer needed. For example, you could use it to remove the Original Media after 30 days.

All clips and their metadata will remain visible in your workspace, but some features may no longer be available for them.

You can configure the workflow to run automatically on a schedule, trigger it manually using a workspace action, or use both.

 **Trigger: Schedule**

The behaviour will be triggered at regular intervals.

Every

Interval

Starting at

Leave empty to start immediately

 **Trigger: Workspace Action**

A workspace action will be added to the application. Please fill in the field(s) below.

Action Label

The action will have this label in the application.

 **Clip Selection**

Search criteria

Clips should match all these filters or they won't be handled.

[+ Add your filter](#)

[Code Mode](#)

 **What to delete from Flow storage**

The clips themselves will still appear in your library. Depending on the media version you select here to be deleted, some features might no longer be available on the clips.

Over the course of the coming releases, more workflow capabilities will gradually be enabled and opened up for general use. In the present release, we are making available **purging workflows**, i.e. the ability to remove certain versions of clips based on time-based or specific filters.

The new workflow engine foundation is introduced as a 'Workflow Library' section as part of the [Workspace Settings](#): users with Account Admin or Workspace Admin permission can now activate and manage basic purge workflows at the workspace level to help manage their data consumption.

Disfluency Filtering for Additional Languages

Filtering of 'disfluencies', i.e. cleaning up the transcript by removing hesitations and intermitted speech artefacts such as "um" or "uh", and repeated words, is now available for the following (17) languages, in addition to English:

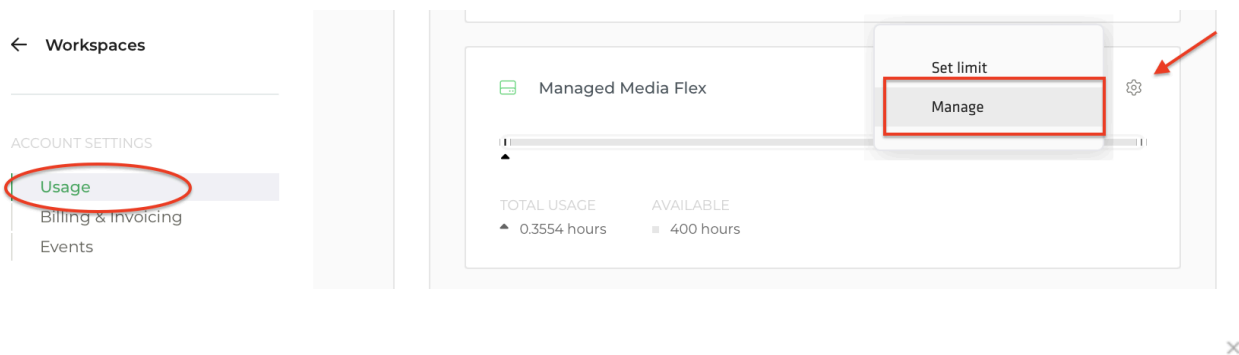

- Arabic (ar)
- Danish (da)
- Dutch (nl)
- English (en)
- French (fr)
- German (de)
- Greek (el)
- Hebrew (he)
- Hindi (hi)
- Hungarian (hu)
- Italian (it)
- Japanese (ja)
- Mandarin (cmn)
- Polish (pl)
- Portuguese (pt)
- Russian (ru)
- Spanish (es)

Enterprise Flex Subscription Plan

An additional subscription plan is introduced retaining the strong enterprise-oriented feature set offered in other Enterprise plans, but with more flexible volume allocations: **Enterprise Flex**. The Enterprise Flex subscription plan allows easily add and remove volume allocations.

Users with Account Admin permission from clients signed up to this new Enterprise Flex subscription plan can manage their allocated volumes for [Cloud Storage](#), [Ingested Media](#) and [Managed Media](#).

From the account settings page, authorised user can adjust (increase or decrease) the allocated capacity as follows:

Ingested Media - Flex

Choose the amount of this resource you want. The pricing preview below gives an indication of the additional cost.

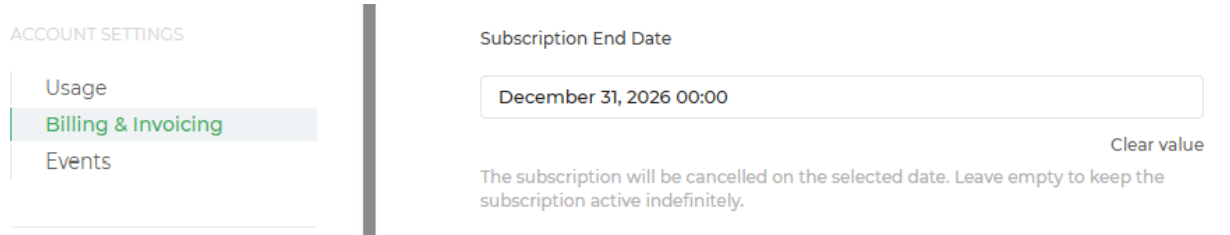

Make your choice

Ingested Media - Flex
€XXX per 100 hour / month (no upper limit)

1 x100 hour

Subscription End Dates

Clients willing to sign up for a seasonal or fixed-term subscription can now set an 'End Date' for their subscription upfront, thereby avoiding any further costs beyond the provisioned period.

The screenshot displays the 'ACCOUNT SETTINGS' interface. On the left, a sidebar lists 'Usage', 'Billing & Invoicing' (highlighted in green), and 'Events'. The main content area is titled 'Subscription End Date' and features a text input field containing 'December 31, 2026 00:00'. To the right of the field is a 'Clear value' link. Below the field, a note states: 'The subscription will be cancelled on the selected date. Leave empty to keep the subscription active indefinitely.'

Users with Account Admin permissions will receive notifications (1-month and 1-week) ahead of an upcoming expiry date. When the end date is reached, the subscription will automatically be deactivated, thus ensuring no further invoices.

Enhanced Functionality

Custom Branding

For Enterprise clients, the following additional custom branding is now possible through contacting Limecraft support:

- Checkbox and tab lines will use the brand color

v1 Created 6d ago

Bat... Account Admin, Production Administrator

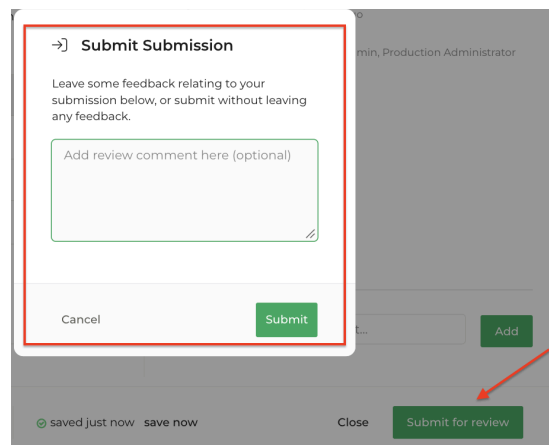

- A custom product name and favicon can be configured, which will appear in the title of the web page and other places

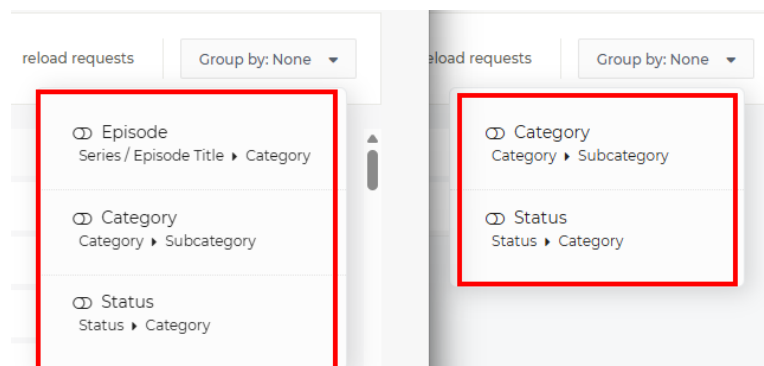

Delivery Workspace Enhancements

This release includes the following set of improvements for Delivery Workspaces:

- (NL-8418) Drag & drop into the browser can now be used to upload files to a delivery request (when combined with storing these files through Limecraft or via MASV, currently not supported for IBM Aspera).
- (NL-8447) The feedback comments on submitting, approving, rejecting or archiving delivery requests can now be configured as part of the request template to be mandatory, optional or omitted.

- (NL-8446) The Limecraft Delivery Workspace has 3 fixed 'Group By' options defined. As these don't all always make sense, it is now possible to omit some of them as part of the setup.

- (NL-8411) The Limecraft Delivery Workspace can now be configured to navigate by default to the request listing instead of to the dashboard as the start page of a workspace

- (NL-8450) Specific validation error messages have been tweaked to make them more readable.
- (NL-8465) An entry in the request listing will now show the assigned reviewer while the corresponding request is in the 'Awaiting Review' state.

The Joker · Episode 2 · Master	Review by Batman	in review	>	...
The Joker · Episode 3 · Master	Assigned to Robin	open	>	...
The Joker · Episode 4 · Master	Assigned to Robin	accepted	>	...
The Joker · Episode 5 · Master	Assigned to Robin	accepted	>	...

- Closing the request dialog will no longer collapse all groups.

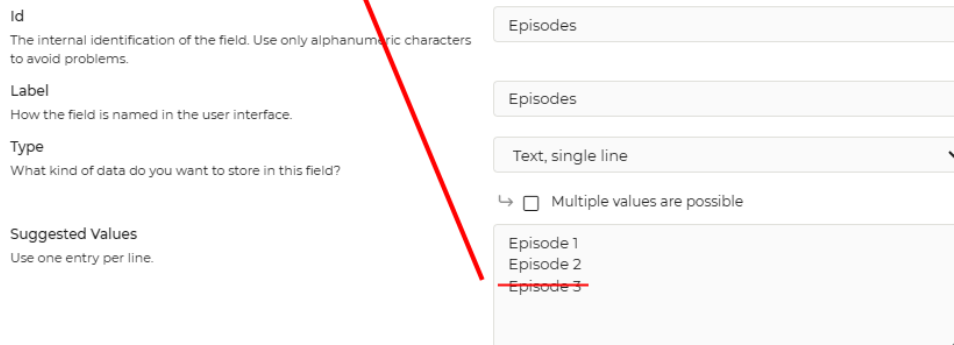

Additional Enhancements

Limecraft Flow

- (NL-8463) Navigating back from clip details to the library overview in a workspace now more properly maintains navigation context.
- (NL-8381) Removing items from a metadata field's 'suggested values' list will now display a warning regarding the potential impact of the operation.

Custom Field Properties

Removing values from the Whitelist may affect existing items. Metadata can no longer be saved for items using a removed value.

The screenshot shows the 'Custom Field Properties' form. It has several sections: 'Id' (internal identification), 'Label' (user interface name), 'Type' (data kind), and 'Suggested Values' (one entry per line). The 'Suggested Values' section contains a list with 'Episode 1', 'Episode 2', and 'Episode 3'. 'Episode 3' is crossed out with a red line. A red arrow points from the 'Suggested Values' list to the warning message at the top.

Id
The internal identification of the field. Use only alphanumeric characters to avoid problems.

Label
How the field is named in the user interface.

Type
What kind of data do you want to store in this field?

Suggested Values
Use one entry per line.

Episodes

Episodes

Text, single line

☐ Multiple values are possible

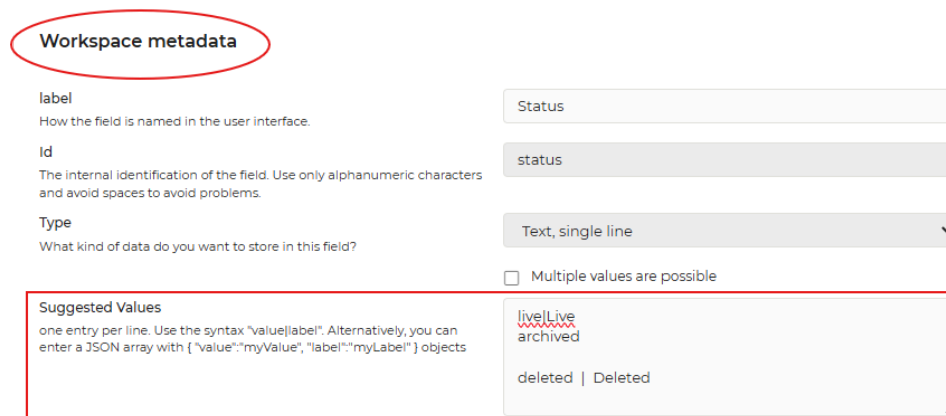

Episode 1
Episode 2
~~Episode 3~~

- (NL-8368) Quota checks for Managed Media now consider the actual value (and no longer the maximum value over the current period).
- (NL-8333) Browser uploads can now handle short network interruptions more reliably.
- (NL-8313) The multicam player can now use 'Camera Id' as well as 'Recording Device' to identify a viewing angle. This allows the multicam player to be used more broadly in existing drama workflows also without requiring configuration changes.
- (NL-8272) Notifications generated from custom workflows more consistently match the style of application-level notifications.
- (NL-8221) Account admins can now delete a Team without having to remove all members first.

Specific Fixes and Corrections

Limecraft Flow

- (NL-8472) Configuring 'suggested values' for workspace metadata fields is now handled more reliably.

Workspace metadata

label
How the field is named in the user interface.

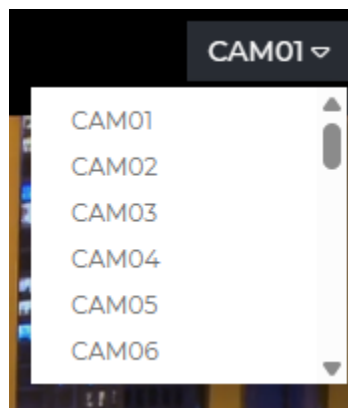

id
The internal identification of the field. Use only alphanumeric characters and avoid spaces to avoid problems.

Type
What kind of data do you want to store in this field?

Suggested Values
one entry per line. Use the syntax "value|label". Alternatively, you can enter a JSON array with { "value":"myValue", "label":"myLabel" } objects

liveLive
archived
deleted | Deleted

- (NL-8468) The specific resizing issue for reopening Limecraft application panels after having all of them closed, is now fixed.
- (NL-8459) The specific scrolling issue when selecting values to filter on Transcription Status, is now fixed.
- (NL-8452) The specific navigating issue from Collection Builder to various other applications (such as clip details, logger, review and transcription), is now fixed.
- (NL-8430) The multicam camera toggle now applies a scrollbar when there are many cameras.

- (NL-8399) The function to “Export to Edit Suite’ no longer resets the selection for included markers when entering the media location.
- (NL-8143) When importing ‘Live Timecode Nodes’ the framerate is no longer incorrectly defaulted.
- (NL-8097) It is again possible to generate watermarks based on custom fields.
- (NL-8015) Adjusting the volume location for media material of a clip at a later stage is now more appropriately handled in an automated manner.

Limecraft Edge

- (FSC-2325) It is now possible to import offloads using Limecraft Edge when combining multiple manifest options (such as MHL and JSON).
- (FSC-2340) It is again possible to execute specific operations (e.g. retry) using Limecraft Edge when a previous manifest file is still in place.
